

Name	Butyl Benzyl phthalate (BBP)
CAS number	85-68-7
EINECS number	201-622-7
What is BBP?	BBP is a substance that is used as a plasticiser to make PVC plastic soft and flexible. It is a colourless and odourless organic chemical.
Where is it used?	BBP is used in a range of soft PVC products but by far its largest single use is in flooring. It is also found in car care products, packaging, artificial leather, and in use with other polymers in sealants, adhesives, paints, coatings and inks.
Why is it used?	<p>Plasticisers are essential to make PVC flexible. PVC is rigid by nature but plasticisers give it similar properties to rubber: it becomes flexible and expandable, whilst retaining its shape.</p> <p>There are many different plasticisers available but a manufacturer of PVC will make what they believe to be the best choice for their particular products.</p> <p>BBP is used because for many years it has provided particularly good processing and end product performance.</p>
Is it safe?	<p>The use of BBP has been carefully considered by EU scientists and it is already well regulated by European legislation relating to toys and childcare articles, cosmetics, food contact materials and medicinal products.</p> <p>Indeed, BBP has been used for more than 50 years without a single known case of anyone having been harmed as a result.</p> <p>BBP is not classified as a human carcinogen or mutagen and it does not accumulate in humans or in the environment</p>
Why is BBP on the REACH Candidate List?	Substances are placed on the Candidate List for authorisation based on their <i>potential</i> to cause harm (their hazard) rather than on any <i>actual</i> risk they may pose. In the case of BBP, it has been put on the candidate list due to reproductive effects that have been seen during tests on rodents. However, as these effects are only seen at levels much higher than humans are usually exposed to, there is no danger from its use in most everyday PVC products.
